(54) SISTEM ȘI PROCEDEU DE GENERARE DINAMICĂ A
INTERFEȚELOR PENTRU APLICAȚII DE CALCULATOR

(57) Rezumat:

Invenția se referă la un sistem și la un procedeu de generare dinamică a interfețelor pentru aplicații de calculator de tip gestiune electronică de informații, care permite personalizarea, de către fiecare utilizator, a propriei interfețe, atât în ceea ce privește elementele de stil, proprietățile, cât și funcționalitățile interfeței. Sistemul conform invenției este format dintr-un sistem (1) hardware de stocare a datelor, care conține informații stocate în fișiere (3) sau baze de date (4), într-un format special, cu ajutorul unor fișiere (2) EBXML, dintr-un sistem (5) hardware de preluare și transmitere a datelor, care cuprinde un server (8) Java și/sau un server (9) HTTP, și dintr-o stație (6) hardware client, care cuprinde un computer (10) utilizator și o mașină (7) virtuală. Procedeu conform invenției constă din preluarea unor informații din fișierele (2) EBXML, stocate în sistemul (1) hardware de stocare a datelor, și transmiterea acestora, de către sistemul (5) hardware de preluare și transmitere a datelor, la stația (6) hardware client, unde informațiile transmise sunt preluate de mașina (7) virtuală care le interpretează în funcție de niște zone numite <components>, <events> sau <data

provider>, fiind apoi generate elemente specifice interfeței (1) grafice de lucru, afișată de computerul (10) utilizator, acesta din urmă primind date pentru modelarea interfeței (11) grafice de lucru de către un operator.

SISTEM ȘI PROCEDEU DE GENERARE DINAMICĂ A INTERFEȚELOR PENTRU APLICAȚII DE CALCULATOR

Prezenta invenție se referă la un sistem și procedeu de generare dinamică a interfețelor adaptabile utilizator care permit personalizarea de către fiecare utilizator în parte a proprii interfețe, atât în ceea ce privește elementele de stil, proprietățile dar și funcționalitățile interfeței. Domeniul de aplicare ale invenției este cel al aplicațiilor informatice de tip gestiune electronică de informații.

În acest moment, se cunosc procedee de generare a interfețelor bazate pe limbajul XML cu ajutorul unor soluții informatice de interpretare a limbajelor UIML, MXML, XUL, XForms, XAML sau SVG.

Principalul dezavantaj al procedeelelor cunoscute este acela că nu au capacitatea intrinsecă de a genera interfețe adaptabile în urma procesării conținutului limbajului ce determină interfața și nici de a permite utilizatorului să personalizeze interfața în fiecare detaliu al acesteia, astfel ca această personalizare să fie independentă de cea a altor utilizatori și să corepundă nevoilor utilizatorului.

Problema tehnică pe care o rezolvă invenția revendicată este realizarea unui sistem și a unui procedeu care să genereze dinamic interfețe diferite în cadrul aceleiași aplicații, interfețe ce pot fi adaptate de către fiecare utilizator în parte fără a afecta funcționarea interfeței și capacitatea de îmbunătățire a acesteia.

Sistemul de generare dinamică a interfețelor, conform invenției revendicate, rezolvă această problemă prin faptul că el este format dintr-un sistem hardware de stocare a datelor ce conține informația într-un format special EBXML, un sistem hardware de preluare și transmitere a datelor și o stație hardware client care conține computerul utilizator, precum și o mașină virtuală (soft) pentru interpretarea informațiilor.

Procedeul de generare dinamică a interfețelor, conform invenției revendicate, constă în preluarea informației din fișierele de tip EBXML, care conțin informațiile necesare și care sunt stocate în sistemul hardware de stocare a datelor, apoi transmiterea acestor informații de către sistemul hardware de preluare și transmitere a datelor către stația hardware client, în care informația este preluată de către mașina virtuală și interpretată funcție de anumite elemente, astfel încât operatorul / utilizatorul își poate personaliza interfața după propriile nevoi.

Sistemul și procedeu de generare dinamică a interfețelor pentru aplicații de calculator, conform invenției revendicate, prezintă următoarele avantaje:

SC SCREAM SRL

- existența unui fișier EBXML permite generarea interfeței adaptabile la nivel de utilizator prin interpretarea acestuia de către mașina virtuală;
- existența unui fișier EBXML permite regenerarea interfeței cu modificările operate;
- procedeul permite salvarea modificărilor din interfața utilizator în mod automat.

Se prezintă, în continuare, un exemplu de realizare practică a sistemului și procedurii de generare dinamică a interfețelor pentru aplicații de calculator conform invenției revendicate, în legătură cu figurile 1, 2, 3 și 4, care reprezintă:

- Fig. 1: schema bloc a sistemului de generare dinamică a interfețelor pentru aplicații de calculator
- Fig. 2: fișierul EBXML
- Fig. 3: interfața utilizator generată de sistem
- Fig. 4: interfața utilizator personalizată de către client

Sistemul de generare dinamică a interfețelor pentru aplicații de calculator conform invenției revendicate, este format dintr-un sistem 1 hardware de stocare a datelor, un sistem 5 hardware de preluare și transmitere a datelor și o stație 6 hardware client (Fig. 1).

Sistemul 1 hardware de stocare a datelor conține informația stocată în fișiere 3 sau baze de date 4 într-un format special cu ajutorul fișierelor 2 EBXML.

Sistemul 5 hardware de preluare și transmitere a datelor conține un server 8 Java și/sau un server 9 HTTP, cu softurile aferente.

Stația 6 hardware client este un sistem static și conține computerul 10 utilizator precum și un soft concretizat într-o mașină 7 virtuală care are rolul de a interpreta informația primită funcție de anumite zone accesate de utilizator pentru a accesa interfața sau pentru a-și genera propria interfață 11 grafică.

Limbajul EBXML este construit pentru a permite mașinii virtuale interpretarea sa facilă astfel încât în baza acestuia să poată fi generată interfața utilizator (Fig. 2).

Informația circulă în ambele sensuri, între toate componentele sistemului de generare dinamică a interfețelor.

Prin circulația dinspre fișierele 2 EBXML către stația 6 hardware client, se generează interfața 11 grafică de lucru la computerul 10 utilizator.

Prin circulația inversă, de la computerul 10 utilizator, aflat în stația 6 hardware client, către fișierele 2 EBXML, utilizatorul poate modifica caracteristicile grafice sau funcționale existente ale interfeței 11 grafică (adică ceea ce se vede pe ecran) funcție de necesitățile sale.

sau de specificațiile sale (de exemplu, el dorește să modifice dimensiunea caracterelor textului afișat pe ecran).

Procedeele de generare dinamică a interfețelor pentru aplicații de calculator, conform invenției revendicate, cuprinde următoarele etape:

- se preia informația din fișierele **2 EBXML** stocate în sistemul **1 hardware** de stocare a datelor;
- sistemul **5 hardware** de preluare și transmitere a datelor transmite informația preluată către stația **6 hardware** client;
- la nivelul stației **6 hardware** client, informația este preluată de mașina **7 virtuală** și apoi este interpretată funcție de zonele numite <components>, <events> sau <data provider>;
- se generează elementele specifice interfeței **11** grafică de lucru afișată de computerul **10** utilizator, adică: componentele interfeței (butoane radio, text, input, etc.), evenimentele (apăsarea unei taste sau combinații de taste, validarea informației dintr-un câmp, încărcarea unor date sau imagini de la serverul **8 Java** și/sau serverul **9 HTTP**) și se furnizează date către computerul **10** utilizator.

Utilizatorul poate modifica elementele interfeței (Fig.3 și Fig.4), iar interfața se regenerează cu modificările operate, pentru o utilizare ulterioară.

Salvarea modificărilor din interfața utilizator se realizează prin regenerarea automată a fișierului EBXML cu modificările operate și transmiterea lui către **1 hardware** de stocare a datelor și se stochează la nivelul fișierelor **2 EBXML**.

Un fișier **2 EBXML** poate fi încărcat dintr-o bază de date, un server **9 HTTP** sau de pe computerul **10** utilizator.

Fișierul EBXML este următorul:

```

REVENDICĂRI

1. Sistem de generare dinamică a interfețelor pentru aplicații de calculator, **caracterizat prin aceea că**, este format dintr-un sistem (1) hardware de stocare a datelor, care conține fișiere (3) sau baze (4) de date și fișierele (2) EBXML, un sistem (5) hardware de preluare și transmitere a datelor care conține un server (8) Java și/sau un server (9) HTTP și o stație (6) hardware client ce conține un computer (10) utilizator și o mașină (7) virtuală.
2. Procedeu de generare dinamică a interfețelor pentru aplicații de calculator cu ajutorul sistemului menționat la revendicarea 1, **caracterizat prin aceea că**, are următoarele etape: se preia informația din fișierele (2) EBXML stocate în sistemul (1) hardware de stocare a datelor, apoi sistemul (5) hardware de preluare și transmitere a datelor transmite informația preluată către stația (6) hardware client, apoi, la nivelul stației (6) hardware client, informația este preluată de mașina (7) virtuală și este interpretată funcție de zonele numite <components>, <events> sau <data provider>, apoi se generează elementele specifice interfeței (11) grafică de lucru afișată de computerul (10) utilizator și se furnizează date către computerul (10) utilizator pentru modelarea interfeței (11) grafică de lucru de către operator.
3. Sistem de generare dinamică a interfețelor pentru aplicații de calculator, **caracterizat prin aceea că**, fișierul (2) EBXML conține informațiile necesare generării interfeței (11) grafică de lucru de către mașina (7) virtuală și are următorul conținut:
